1 Introduction to PyLaTeX

This document demonstrates all available types in the PyLaTeX system. It includes *formatted text*, inline code, and much more.

1.1 Text Formatting

We support bold text, *italic text*, monospace text, and even ***bold italic combined!***

1.2 Hyperlinks

Visit [GitHub](#) for more information. You can also check [Python.org](#).

1.3 Lists and Enumerations

1.3.1 Unordered List

- First item in the list
- Second item with **bold text**
- Third item with a link

1.3.2 Ordered List

1. First step
2. Second step with *emphasis*
3. Third step with code

1.4 Block Quotes

As the famous saying goes:

1.5 Code Examples

Here's an example using verbatim environment:

```
def fibonacci(n):  
    if n <= 1:  
        return n  
    return fibonacci(n-1) + fibonacci(n-2)  
  
# Calculate Fibonacci numbers
```

```
for i in range(10):
    print(f"fib({i}) = {fibonacci(i)}")
```

1.6 Special Characters

LaTeX special characters are properly escaped:

- Dollar signs: \$100
- Ampersands: Tom & Jerry
- Percent: 100% complete
- Hash: #hashtag
- Underscore: variable_name
- Braces: {curly} braces
- Tilde: ~/home/user
- Caret: 2¹⁰

1.7 Nested Structures

Complex nesting is fully supported:

- **Outer item with bold** containing:
 - *Nested italic item*
 - Nested item with `code link`
- Another outer item
 1. Nested ordered item 1
 2. Nested ordered item 2

1.8 Custom Environments

You can create custom LaTeX environments:

Centered and formatted text
This uses a custom environment

1.9 Putting It All Together

This comprehensive example shows how to combine *all the features* together. You can visit our repository for more examples.

1. **Benefit 1:** Type-safe document generation
2. **Benefit 2:** Programmatic control over *all elements*
3. **Benefit 3:** Easy integration with `markdown` parsing

2 Conclusion

This document showcased all major components of the PyLaTeX system including: text formatting, links, lists, quotes, code blocks, special characters, nested structures, and custom environments.
